Velos

Less work, improved

Nedap Velos, the new control system for pig breeding, provides you with the solution. Velos feeds your sows, indicates when they are on heat, separates them and keeps them in top form. Velos provides you with a complete and up-to-date overview of the state of affairs in your business – anytime, anywhere – enabling you to make the right decisions. Nedap Velos: the ideal employee.

Sows can be fed more efficiently.

Opt for electronic feed supply with Nedap Velos. This way you will be sure that each gestating sow receives the right amount of food at the right time. Not only does this have a proven positive effect on the condition of your pigs, it also positively affects your results. Feed represents a considerable share of the costs incurred by a sow breeder's. Nedap Velos ensures the feeding process is controllable and as such contributes directly to your profits.

Quicker separation.

Leave it all to Nedap Velos. The system ensures that sows are separated automatically. Without your intervention, at a time that is convenient to you. All by means of a single unit. You are also kept exactly up-to-date about the state of affairs. Nedap Velos simplifies the inspection, selection and separation of each individual pig. The time you save translates directly into better results.

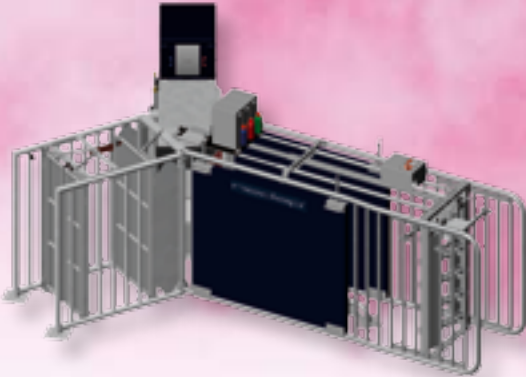

Better heat detection.

Nedap Velos is extremely accurate. When a pig is on heat, the system detects this at an early stage and reports it immediately. It alerts in good time that a sow should be inseminated, so you don't have to keep an eye on this yourself. More accurate heat detection of a sow helps you to operate more efficiently. Optimisation of such a critical element of your operations: it saves time and boosts profits from day one.

Nedap Velos. The standard in Livestock Management

feeding, better results.

■ Individual feed supply.

In the feeding station, the sow can eat while protected from other sows in the group. The feed is supplied in doses and is geared to the sows' gestation speed. Velos reports daily which sows have eaten too little.

■ Automatic separation.

You determine when this unit separates the sows. It is completely automatic, and works without human intervention.

■ Heat detection.

Velos registers the interest a sow shows in the boar. On the basis of that information, it detects deviant behaviour and tells you when a sow is on heat.

Velos

The standard in Livestock Management

■ Nedap Velos Worldwide Network

Nedap Agri is global market leader in developing and producing automated systems for the dairy and pig industry. Nedap's know-how ranges from RFID application on livestock, primary process control through to complete management systems.

■ Easy

- Integrated software: connect to your PC and start straight away.
- Internet method: as easy as browsing a website.
- Can be operated via different PCs (network) or the Internet (remotely).

■ Flexible

- Automatic updates: you always work with the latest version.
- Grows with your business: automatically applies expansions to your system.
- Webcams can be connected directly to the system.

■ Reliable

- Specialist support: immediate system service.
- Fast checks and solutions to any problems.
- The most reliable system of its kind.
